List of Tables

VM1-1 Data preparation

This document was prepared in Overleaf, as an Rtex file implementing knitr. Any output is generated by R during compilation, and can thus be replicated by entering the same commands referencing the same dataset. Overleaf’s R version and selection and versions of packages are not under the user’s control. This section demonstrates the R version and the list of packages used for calculations and output generation. <https://cran.r-project.org/web/packages/psych/psych.pdf>

```

**Figure VM1-7**

How many HITs (in total) have you completed on Amazon Mechanical Turk in your lifetime?

VM1-2.3 Postquestionnaire**VM1-2.3.1 Motivation**

Five questions were answered on a scale from 1–5: Strongly disagree—Disagree—Neither agree nor disagree—Agree—Strongly agree.

- **Post1:** I wanted to make as much bonus money as possible.
- **Post2:** I wanted to make more bonus money than other players.
- **Post3:** I felt responsible for other players.
- **Post4:** I wanted to make other players switch color.

- **Post5:** I did not care at all what happened in this game.

```

Dictator game: Expectation vs. behavior

VM1-3 Scales in Study 1

VM1-3.1 HEXACO scales

VM1-3.1.1 Source

Brief HEXCACO inventory (BHI). The 24-item Brief HEXACO Inventory (De Vries, 2013) offers scales for all six personality factors:

1. H: Honesty-Humility (4 items)
2. E: Emotionality (4 items)
3. X: eXtraversion (4 items)
4. A: Agreeableness (4 items)
5. C: Conscientiousness (4 items)
6. O: Openness to Experience (4 items)

Each item was rated on a scale from 1–5 with 1 = strongly disagree, 2 = disagree, 3 = neutral (neither agree, nor disagree), 4 = agree, and 5 = strongly agree.

HEXACO-60: 60 item version (only H). In addition, participants completed the full Honesty-Humility scale of the 60-item HEXACO-60 scales (based on the HEXACO-PI-R) in the self report form (Ashton & Lee, 2009).

Items were presented in a matrix and answered on a five-point scale (1–5): strongly disagree (1) —(2) — neither agree nor disagree (3) —(4)—strongly agree (5).

VM1-3.1.2 Items

Brief H-scale.

- I find it difficult to lie. (bH1+)
- I would like to know how to make lots of money in a dishonest manner. (bH2-)
- I want to be famous. (bH3-)
- I am entitled to special treatment. (bH4-)

Brief E-scale.

- I am afraid of feeling pain. (bE1+)
- I worry less than others. (bE2-)
- I can easily overcome difficulties on my own. (bE3-)
- I have to cry during sad or romantic movies. (bE4+)

Brief X-scale.

- Nobody likes talking with me. (bX1-)
- I easily approach strangers. (bX2+)
- I like to talk with others. (bX3+)
- I am seldom cheerful. (bX4-)

Brief A-scale.

- I remain unfriendly to someone who was mean to me. (bA1-)
- I often express criticism. (bA2-)
- I tend to quickly agree with others. (bA3+)
- Even when I'm treated badly, I remain calm. (bA4+)

Brief C-scale.

- I make sure that things are in the right spot. (bC1+)
- I postpone complicated tasks as long as possible. (bC2-)
- I work very precisely. (bC3+)
- I often do things without really thinking. (bC4-)

Brief O-scale.

- I can look at a painting for a long time. (bO1+)
- I think science is boring. (bO2-)
- I have a lot of imagination. (bO3+)
- I like people with strange ideas. (bO4+)

H60-scale.

- I wouldn't use flattery to get a raise or promotion at work, even if I thought it would succeed. (H60_01+)
- If I knew that I could never get caught, I would be willing to steal a million dollars. (H60_02-)
- Having a lot of money is not especially important to me. (H60_03+)
- I think that I am entitled to more respect than the average person is. (H60_04-)
- If I want something from someone, I will laugh at that person's worst jokes. (H60_05-)
- I would never accept a bribe, even if it were very large. (H60_06+)
- I would get a lot of pleasure from owning expensive luxury goods. (H60_07-)
- I want people to know that I am an important person of high status. (H60_08-)
- I wouldn't pretend to like someone just to get that person to do favors for me. (H60_09+)
- I'd be tempted to use counterfeit money, if I were sure I could get away with it. (H60_10-)

VM1-3.2 Psychological reactance scale

VM1-3.2.1 *Source*

We used a refined, 11-item version of the Hong psychological reactance scale Hong and Faedda, 1996. Items were answered on a five-point scale from 1–5: strongly disagree (1) —(2) — neither agree nor disagree (3) —(4)—strongly agree (5)

VM1-3.2.2 *Items*

- **PR01:** Regulations trigger a sense of resistance in me.
- **PR02:** I find contradicting others stimulating.
- **PR03:** When something is prohibited, I usually think "that's exactly what I am going to do.
- **PR04:** I consider advice from others to be an intrusion.
- **PR05:** I become frustrated when I am unable to make free and independent decisions.
- **PR06:** It irritates me when someone points out things which are obvious to me.
- **PR07:** I become angry when my freedom of choice is restricted.
- **PR08:** Advice and recommendations induce me to do just the opposite.
- **PR09:** I resist the attempts of others to influence me.
- **PR10:** It makes me angry when another person is held up as a model for me to follow.
- **PR11:** When someone forces me to do something, I feel like doing the opposite.

VM1-3.3 Oxford Utilitarianism Scale

VM1-3.3.1 Source

This scale is published in Kahane et al. (2018) and contains two subscales: impartial beneficence (OUS-IB, 5 items) and instrumental harm (OUS-IH, 4 items). Answers were given on a seven-point scale (scored 1–7): Strongly disagree—Disagree—Somewhat disagree—Neither agree nor disagree—Somewhat agree—Agree—Strongly agree.

VM1-3.3.2 Items

Impartial Beneficence.

- **IB1+**: If the only way to save another person’s life during an emergency is to sacrifice one’s own leg, then one is morally required to make this sacrifice.
- **IB2+**: From a moral point of view, we should feel obliged to give one of our kidneys to a person with kidney failure since we don’t need two kidneys to survive, but really only one to be healthy.
- **IB3+**: From a moral perspective, people should care about the well-being of all human beings on the planet equally; they should not favor the well-being of people who are especially close to them either physically or emotionally.
- **IB4+**: It is just as wrong to fail to help someone as it is to actively harm them yourself
- **IB5+**: It is morally wrong to keep money that one doesn’t really need if one can donate it to causes that provide effective help to those who will benefit a great deal.

Instrumental Harm.

- **IH1+**: It is morally right to harm an innocent person if harming them is a necessary means to helping several other innocent people.

- **IH2+**: If the only way to ensure the overall well-being and happiness of the people is through the use of political oppression for a short, limited period, then political oppression should be used.
- **IH3+**: It is permissible to torture an innocent person if this would be necessary to provide information to prevent a bomb going off that would kill hundreds of people.
- **IH4+**: Sometimes it is morally necessary for innocent people to die as collateral damage—if more people are saved overall.

*Note*¹

VM1-3.4 Cognitive Reflection Test (CRT)

VM1-3.4.1 Source

Participants responded to four items measuring cognitive reflection (Frederick, 2005). Three items were taken from the CRTt (Woike, 2019), the final item from the CRT 2 (Thomson & Oppenheimer, 2016).

VM1-3.4.2 Items

- **CRT01:** A golden bat and a golden ball cost \$5,000 in total. The bat costs \$4,000 more than the ball. How much does the golden ball cost?
- **CRT02:** If it takes 10 machines 10 minutes to make 10 widgets, how long would it take 1,000 machines to make 1,000 widgets?
- **CRT03:** In a lake, there is a patch of lily pads. Every day, the patch doubles in size. If it takes 40 days for the patch to cover the entire lake, how long would it take for the patch to cover a quarter of the lake?
- **CRT04:** If you're running a race and you pass the person in second place, what place are you in?

VM1-3.4.3 Item preparation

Figure VM1-64

CRT scores: Distribution and inter-correlation of subscale values

Only the CRTscore variable² is used for further analysis. Both measures are (as expected) highly correlated, as most incorrect answers are "intuitive" answers.

VM1-3.5 EXP

VM1-3.5.1 Source

This scale was developed by the authors.

VM1-3.5.2 Items

- Imagine that you have one single tennis ball. You double the number of tennis balls you have twenty times in a row. How many tennis balls do you have after this?
- Imagine that there is a pool filled with 100 liters of a chemical. Due to an ongoing reaction, it takes one day for the contents of the pool content to grow by half (as measured at the start of the day). After a full week, how many liters will be in the pool?
- Imagine that there is one alien. After one week this alien splits into five aliens. After the second week each of these five aliens splits into five, which in turn split into five after the third week. The same happens after the fourth and fifth week. How many aliens are there now?
- There is a bottle with a strange liquid. At the beginning of each hour, its volume is measured. The liquid loses exactly 10% of this measured volume at the end of each hour. After 10 hours, what percentage of the liquid is left?

EXP scores: Distribution and inter-correlation of subscale values

VM1-3.6 BNT

VM1-3.6.1 Source

The four numeracy items comprising the Berlin numeracy test (Cokely et al., 2012) were included in the survey.

VM1-3.6.2 Items

- Imagine we are throwing a five-sided die 50 times. On average, out of these 50 throws how many times would this five-sided die show an odd number (1, 3 or 5)?
- Out of 1,000 people in a small town 500 are members of a choir. Out of these 500 members in the choir 100 are men. Out of the 500 inhabitants that are not in the choir 300 are men. What is the probability that a randomly drawn man is a member of the choir?

- Imagine we are throwing a loaded die (6 sides). The probability that the die shows a 6 is twice as high as the probability of each of the other numbers. On average, out of these 70 throws, how many times would the die show the number 6?
- In a forest 20% of mushrooms are red, 50% brown and 30% white. A red mushroom is poisonous with a probability of 20%. A mushroom that is not red is poisonous with a probability of 5%. What is the probability that a poisonous mushroom in the forest is red?

VM1-3.7 Subjective Numeracy

VM1-3.7.1 Source

A very brief, three-item measure of subjective numeracy (McNaughton et al., 2015) was administered.

VM1-3.7.2 Items

Items were scored on different scales with the same number range between 1–6, higher numbers indicating higher subjective numeracy.

- How good are you at working with fractions?
- How good are you at figuring out how much a shirt will cost if it is 25% off?
- How **often** do you find numerical information to be useful?

VM1-3.8 Dark Core

VM1-3.8.1 Source

A 16-item short measure of the dark core of personality (Moshagen et al., 2019) was part of the survey.

VM1-3.8.2 Items

Items were presented in a matrix and answered on a five-point scale: Strongly Disagree—Disagree—Neutral—Agree—Strongly Agree; plus and minus in brackets represents the direction of the item.

- **DC01-**: It is hard for me to see someone suffering.
- **DC02+**: Payback needs to be quick and nasty.
- **DC03-**: All in all, it is better to be humble and honest than important and dishonest.
- **DC04+**: My own pleasure is all that matters.
- **DC05-**: I cannot imagine how being mean to others could ever be exciting.
- **DC06+**: People who get mistreated have usually done something to bring it on themselves.
- **DC07-**: Hurting people would make me very uncomfortable.
- **DC08+**: It's wise to keep track of information that you can use against people later.
- **DC09-**: I feel sorry if things I do upset people.
- **DC10+**: People who mess with me always regret it.
- **DC11+**: Why should I care about other people, when no one cares about me?
- **DC12+**: I would like to make some people suffer, even if it meant that I would go to hell with them.
- **DC13-**: Most people deserve respect.
- **DC14-**: I make a point of trying not to hurt others in pursuit of my goals.
- **DC15+**: I would be willing to take a punch if it meant that someone I did not like would receive two punches.
- **DC16-**: I avoid humiliating others.

VM1-3.9 Climate Change Skepticism

VM1-3.9.1 Source

Climate change skepticism was measured with five items taken from Lewandowsky et al. (2015) and one from Lewandowsky et al. (2013).

VM1-3.9.2 Items

Items were presented in a matrix and answered on a five-point scale (1–5): Strongly disagree—Disagree—Neutral—Agree—Strongly agree.

- **CC1+**: I believe that the climate is always changing and what we are currently observing is just natural fluctuation.
- **CC2-**: I believe that most of the warming over the last 50 years is due to the increase in greenhouse gas concentrations.
- **CC3-**: I believe that the burning of fossil fuels over the last 50 years has caused serious damage to the planet's climate.
- **CC4-**: Human CO₂ emissions cause climate change.

- **CC5+**: Humans are too insignificant to have an appreciable impact on global temperature.
- **CC6+**: The claim that the climate is changing due to emissions from fossil fuels is a hoax perpetrated by corrupt scientists who want to spend more taxpayer money on climate research.

VM1-3.10 Social and Economic Conservatism Scale

VM1-3.10.1 *Source*

The Social and Economic Conservatism Scale (Everett, 2013) consists of 12 items in 2 subscales.

VM1-3.10.2 *Items*

Responses were given on slider scales from very negative (-100) to very positive (+100).³

- **SC01-**: Right to abortion
- **EC01-**: Welfare benefits
- **EC02+**: Limited government
- **SC02+**: Military and national security
- **SC03+**: Religion
- **EC03+**: Gun ownership
- **SC04+**: Traditional marriage
- **SC05+**: Traditional values
- **EC04+**: Fiscal responsibility
- **EC05+**: Business
- **SC06+**: The family unit
- **SC07+**: Patriotism

VM1-3.14 COV-Social Distancing

VM1-3.14.1 Items

Items were answered on a six-point scale (1–6): Strongly disagree—Disagree—Slightly disagree—Slightly agree—Agree—Strongly agree.

- **CVSD1-**: People need to demonstrate against the current restrictions of liberties such as enforced social distancing.
- **CVSD2-**: Social distancing is mainly driven by personal fear.
- **CVSD3+**: Social distancing helps to protect others.
- **CVSD4-**: Social distancing is driven by political agendas.
- **CVSD5+**: Social distancing as a prevention measure is backed up by science.
- **CVSD6-**: Social distancing is a useless tool against the novel coronavirus.

COV-Social Distancing: histogram of scores

VM1-3.15 COV-Misinformation

VM1-3.15.1 Source

Some of the items (CVMI01+, CVMI03+) were taken from Pennycook et al. (2020). Another item (CVMI04+) was taken from Geldsetzer (2020), the item asking for risk groups (CVMI07-) were inspired by this source.

VM1-3.15.2 Items

Items⁴ were presented answered on a six-point scale (1–6): Extremely unlikely—Moderately unlikely—Slightly unlikely—Slightly likely—Moderately likely—Extremely likely.

- **CVMI01+**: The seasonal flu is just as dangerous as COVID-19.
- **CVMI02+**: Warm weather effectively stops COVID-19 from spreading.
- **CVMI03+**: A cure for COVID-19 has already been discovered but is being suppressed by people who want the pandemic to continue.
- **CVMI04+**: The current coronavirus is a bioweapon developed by a government or a terrorist organization.
- **CVMI05+**: Most people are immune to COVID-19.
- **CVMI06+**: The United States has tested a larger percentage of its population than any other country has.
- **CVMI07-**: People above the age of 60 are at a higher risk from COVID-19.
- **CVMI08-**: There is no vaccine against COVID-19.
- **CVMI09+**: The US has a lower absolute number of COVID-19-related deaths than many European countries.
- **CVMI10+**: God has sent COVID-19 to punish sinners.

VM1-3.15.3 Item preparation

⁴Two items in the question block were not used for scale construction, as they were conceptually distinct. These are: "The health of the economy is more important than the health of a small minority of vulnerable people." and "Lockdowns cause more harm than benefit." These issues are taken up in a different scale. Three more items were taken out, because the items showed low correlations with the scale. The misunderstanding for these items was more due to a discrepancy with medical facts, but not a motivated misunderstanding. These items are "Children are at a higher risk from COVID-19" (a companion item to CVMI07-), "It is not possible to contract COVID-19 if I always stay away six feet from others.", and "Doctors prescribe antibiotics to kill viruses." The last item was taken from the science knowledge test in Pennycook et al. (2020). These items are presented in the preceding section.

VM1-3.16 COV-Tradeoffs***VM1-3.16.1 Items***

Items were answered on a six-point scale (1–6): Strongly disagree— Disagree— Slightly disagree— Slightly agree— Agree— Strongly agree.

- **CVTO1:** We need to accept that some members of vulnerable populations will die so that we can live our lives without severe restrictions.
- **CVTO2:** We need to accept that some members of vulnerable populations will die so that we can attend large sports events again.
- **CVTO3:** We need to accept that some members of vulnerable populations will die so that children can attend school again.
- **CVTO4:** We need to accept that some members of vulnerable populations will die so that we can quickly return to work again.
- **CVTO5:** We need to accept that some members of vulnerable populations will die so that we can go on vacation again.
- **CVTO6:** We need to accept that some members of vulnerable populations will die so that we do not lose too many jobs.

VM1-3.17 Dice game**VM1-3.17.1 Source**

Participants completed 15 rounds of a computerized version of the dice game introduced in Kanngiesser et al. (2020). Each dice choice is considered as an item of the scale.

VM1-3.17.2 Items

Each item is a choice between 16 dice. The expected average choice is 3.5, and we deduct 3.5 from each dice result (which amounts to 52.5 total points) to attain a measure of over-reporting and dishonesty. The variables are saved as embedded variables in Qualtrics, as the task is generated by JavaScript and does not use standard Qualtrics elements.

VM1-4 Qualitative Data

VM1-4.1 Game Strategy

PostTGstrategy

- I wanted to maximize points in case I was blue at the end.
- I picked the risky actions at the start of the game in order to built up more points as there is a lower amount of purple players but as the game continue it was safer to pick the less risky options (8 pt as opposed to 40 pt) since it's likely that the number of purple players would increase as well. Due to the risk of turning purple, it was more important to me to aim for lower pts than to risk losing all pts.
- I wanted to avoid becoming purple, but I also wanted to earn points. I had no idea what color I was and did not have enough information to make a really informed choice. So, I went back and forth between different choices and really just hoped I stayed blue.
- My strategy was to be a big cautious and to pick my spots for when I wanted to gamble a bit. Overall, I was pretty hesitant all game.
- I picked H most times, but also threw in random G's just to decrease the chance to turn colors.
- In the beginning, not a lot of people were purple so I chose the higher risk option (H). Later on, I played it safe and stayed with option G throughout the duration to earn a possible bonus.
- Extremely conservative, taking the minimal risk of converting.
- I always chose H because it was the highest potential payoff.
- I tried to minimize other peoples risk by almost always choosing G. My goal was to make a little bonus, but you can't make any if your purple. If many of the 100 people chose to be selfish, or try to profit as much as possible, I imagine a lot of people are now purple.
- I would try to keep it safe by choosing 8 then go for 40 when it felt right.
- I stuck with the safest option always, for fear of turning purple.
- I would describe my strategy as similar to any ambitious player. The beginning half is about getting as much points as possible because it's unlikely you will get a purple player. The end, if you are still blue, then you would to mix it up so that you are still making points but lowering your risk to 15% since it's a mix of G & H
- I wanted as many points as possible. I didn't expect to be blue at the end of the game, so on the off chance that I am, I want the payout to be as large as possible.
- I chose based on instinct. I follow my gut and if it led me astray, then so be it.

- I hoped to high roll the whole game and get lucky.
- I switched between picking H and G to even out my playing field, I wanted the most bonus money but also didn't want to end up being purple so I took risks when needed
- low risk- behaving as if i were blue from the get-go and giving myself the best possibility of surviving as blue. as a blue, i do not change others, and hopefully we can all survive with some amount of bounty. but i knwo i cannot control chmace, nor can i control other people's strategies or their motivations. but i play to do as little harm as possible.
- at first i wanted to choose "H" every time because it was more exciting and this is just a game. but then i thought about it as a more real world situation, and then realized it was real world because some people were going to get paid and some people were not- so i started going with "G" repeatedly because everyone getting a little i guess is better than a few getting more- although much less exciting or enjoyable to play.

VM1-4.2 Seen similarities

- nothing i can think of really. maybe playing low stakes gambling and playing safe to survive rounds
- Reminds me of socio-economic inequality. Sometimes people take risks that make everyone else worse off.
- Luck based games such as Roulette.
- This game actually reminds me of a class procedure I did in school- everyone had a cup of water, and walked around the room pouring some of their water into someone else's cup. The cups of water were to represent STDs, and how they spread- so we had basically infected other people, which is similar to how the purples turn the blue a different color.
- It feels like an iterative version of a prisoner's dilemma game.
- Nothing I've encountered, at least?
- There was a game show I watched in a statistics class in high school where two players had to chose an option, and if they both chose the same option they would either lose or gain money.
- It reminded me of a game show. Some people could have gotten greedy and lost their whole bonus, instead of taking what was given to them.
- I guess it sort of reminded me of STDs, that risky behavior increases infection rate
- It reminds me of "faith" based games were a group of people have to trust one another not to screw each other up.

Parallels to COVID-19 (or viruses, in general) were identified spontaneously by 19 participants. The following are examples for these statements

- This reminds me of current stay at home/social distancing decisions now.
- COVID-19, people not social distancing and could infect other people.
- COVID-19 and Social Distancing. In a blue and purple pairing, if both choose G there is less likely to be a spread of purple. If one chooses G and the other H, then there's still a chance of spread but less of it. If both choose H, the risk is highest.
- It reminds me of real life and people going out to buy things during the pandemic.
- It reminds me of how a virus spreads. In other words, a pandemic similar to the one we are currently experiencing; with some acting responsibly, and others out of avarice.
- Reminds me a little of punnett squares in biology. Also reminds me of the contamination graphs and statistics I've seen regarding COVID-19. If two folks are both wearing a mask and neither one is infected no one will get the virus, if one is and one isn't but only one is wearing a mask they will be protected but if in that same situation they were both wearing masks but still coming into contact the likelihood of contagiousness is lower
- Social distancing. Making choices that benefit the collective vs the individual.
- Coronavirus. Dangerous behaviors not only increase the chances of that individual being infected, but also increase the rate of infection within the entire community. So it ultimately is self-defeating.
- The idea that some people have an "every man for himself" mentality and will take more risk/put others at risk more specifically with regard to Covid-19.
- The spread of Covid-19, or any other infectious disease for that matter.
- the way that you turn from blue to purple kind of reminds me of the way infection can work (have been thinking about the passing of germs/illness because of the pandemic)

VM1-4.3 Messages

VM1-4.4 General comments

- I would love to see the results of this game!
- i was nervous about being 'turned' purple. and not knowing. and how many people did i turn purple by accident.
- Honestly I think hardly anyone actually got a bonus. People are just not safe.
- I think the concept was really cool, and well executed
- Lots of instructions but I played mostly like I had assumed I wasn't going to win. Which is actually really interesting because I do believe with the current measures I'm taking my outlook for not getting covid 19 is higher than the likelihood I'd end the game as a blue player.

Example	Message to G-players	Message to H-players
1	Risk averse.	Not risk averse.
2	Good job, at least they were worried about other players.	Greed isn't everything but we are all humans.
3	Thank you for choosing the option that benefitted everybody!	Be careful not to get too greedy - the chances of losing the entire bonus grow much faster than you might think!
4	Smart people who don't take unnecessary risks	People that don't care about how risky something is.
5	You went pretty safe huh	Going for the best bonus just like me
6	I appreciate your consideration, we have the same value.	If you didn't change to purple , good for you.
7	Playing it safe - it makes sense to me.	Risky and could mess up other peoples chances of staying blue, but could also potentially get you a lot of bonus money.
8	Thank you, you minimized everyone's risk.	You increased the risk for everyone. The extra bonus might not have been the worth of risk of losing all of it
9	You are very conservative and probably nice. I think we may have a lot in common.	You are very bold. That's admirable (at best), but I probably wouldn't depend on you as a friend.
10	They chose the less risky option and so they're smart.	They're risk-takers and gamblers, so they can't be upset if they turned up purple at the end.
11	It's a decent strategy	They are braver than I was.
12	Thanks!	You are only fighting against and defeating yourself.
13	Are you not worried about money?	You clearly wanted to max out on potential
14	This seems smarter but you never know how other people are reacting.	Everybody want's more don't feel bad.

- I think this game is interesting, and is actually kind of fun.
- I think this is a very nice way of showing people how their selfish actions can affect others, and would be useful for a lot of people to learn!
- Not really, it was mostly nerve wrecking if i thought too much about it. I went with my gut feeling. There might be a high probability that I'm a purple player, but at least I enjoyed the game. Sort of how life is: you should enjoy as much of it as you can. Take risks. No one gets out alive anyway. Also I wish you all good luck with the study and stay safe!
- The strategy was a lot of fun , and it is the ultimate risk/reward game which I found appealing.
- It was fun and challenging and interesting to try to strategize.

VM1-4.5 COVID-19 comments

- I am following orders and doing my part, but I do think it is not as severe as they say. I think it is doing more harm to the economy than anything.
- It has been very difficult for me any family. I have experienced a great amount of anxiety and social isolation which has been tough and the financial impact has been devastating.
- i just want it to go away
- There is nothing more important than limiting the number of death. Rushing to reopen the economy is just going to create disasters. With the current federal government failing to take the lead, the cases in the reopened areas for sure will increase.
- Just that this seems like a long term thing. It's like Nature is rebelling and to this day there is no end in sight. Everyone should stay safe and practice social distancing.
- First it was flatten the curve now its wait for a cure to end the lockdown....no proof we will ever have a cure
- We have lost so many people because of the stupidity and narcissism of the current occupant of the white house.
- I would only add that I think it should be science - not politics or economic concerns - that dictate reopening.
- Though I have not been tested yet it is likely that I have COVID as two of the people I am currently living with tested positive
- I just want to stay healthy, man.
- The world copied my isolated OCD lifestyle.

- I think the people who refuse to socially distance are very selfish and need to learn how to be more comfortable by themselves at home. There are many people who live at home alone and have been doing so for many years. It isn't as hard as they make it out to be. We must continue this for the sake of our friends and family and their health. I live with people who are high risk and I don't want to hurt them just because some selfish idiot can go out and party.
- In my opinion, the media overblew the COVID-19 crisis.
- Horrible mess that has confirmed many of my worst fears about the human species.
- I'm shocked at how quickly it became a political football. I knew that we were a nation divided, but I didn't think people would be so willing to cause actual deaths in order to score political points.
- Our state opened way too early and the average person doesn't have enough money to choose not to work, the poor are being sacrificed so the rich can get fancy meals and haircuts. They don't care about us.
- Go research how hydroxychloroquine and zinc work well against COVID-19 and how it was suggested by the President back in April and how well its doing in some countries (like France)
- I started out very afraid and over time feel more numb about it. It's hard to know what's true with so many opposing views flooding the media. I cannot stay home forever. We wear masks, use sanitizer and remain socially distant.
- Yes. I believe that the virus ran through the USA starting back in November. Many people had horrific flu during that time that may have been the virus. I believe there is now herd immunity. I believe the virus is mainly a powerful pneumonia. People who are bedridden, obese, move very slowly, have pre existing conditions are more likely to die from pneumonia. I do believe the virus is man made. I believe humans do have healthy immune systems generally speaking and so can get over the virus and survive. I believe the virus heavily favors men over women. I don't believe families with children should struggle to survive , having lost jobs, income and ability to feed themselves, so that very elderly patients who are going to die anyway, should live. The human condition itself is fatal. No one gets out alive. It has always been survival of the fittest on this planet and that remains the same as long as we live here. I doubt very much that elderly grandparents want society to crash and a depression ensue so they can live longer. Too many virus death statistics are skewed. Roy Horn is said to have died from the virus. He was MAULED by a tiger 17 years ago. The attack severed Horn's spine, drained his blood, and severely injured other parts of his body, permanently impairing his motor and verbal abilities. He also had a stroke either before or after Montecore dragged him offstage. He was 75 years old when he finally died. He most likely was bedridden and the pneumonia part of the virus killed him. Pneumonia deaths are the leading cause of death for nursing home, elderly and people with preexisting debilitating conditions. To lock down the entire world for a virulent for of pneumonia is idiotic. We are living in an idiocracy now, with the world dumbed

down by the internet. Finally I don't think the constitution was written with an exemption for illness or bad germs. Men do not belong locked at home. Since men are the main targets and old men, let them take their chances out in the world. Perhaps, if we must, keep women and children home and of course old and infirm people but let the healthy men out. Oh and as a side point remember when they said masks wouldn't help and now they are mandating them? Yeah, I don't trust anything the media or people with a vested interest in vaccines have to say. When hospitals make more per covid patient than for regular pneumonia patients, and hospitals can make no money from elective surgeries then hospitals are incentivized to diagnose covid over any other diagnose and put people on ventilators. Money talks, in all walks of life. We never did see people falling on their faces, as we saw in Chinese video's. Wonder why. The local homeless population is doing well and have added more tents to the local tent city at my nearby park. They do not wear masks, gloves or obviously wash much. They have no problem begging on the local street corners as usual and many of these are old men, or unhealthy looking drug addicts. Their immune systems must be protecting them. So I use my own discerning abilities to decide for myself, if I should go outside and wear a mask etc.

- i just dont know whether quarantining and social distancing is effective enough to out-ways the cons of not working/socializing. I also dont like how certain videos are being taken down by youtube/facebook- the more open the discussions the better i feel. im not heartless or a trump supporter- i understand its devastating to older folks and people with weakened immune systems- but i do think the pandemic fire is being stoked by the media- i dont think its as harmful as theyre saying... i dont know.
- I've seen people online spreading pseudoscience and people who completely lack empathy. The opposite is also true, but I wish there were less people out there that were willfully ignorant or uncaring of hurting others. And besides, if we protect others then we should hope that they would do the same for us so that it is a net gain to all of our safety. To think that you should only protect your own and to hell with other people only puts that individual at a higher risk of contracting the disease if everyone thought that way. It's intellectually bankrupt in my opinion. I don't think there is much we can do other than wait patiently for a vaccine, economy be damned.

VM1-4.6 Final

- thought it was really different and fun and paid well
- Pretty fun and not too long.
- that was long. i don't like math. thank you. goodnight.
- The survey has a lot of question that I had to think about. It was fun to do and made me further question my morals between different topics.
- I'd love to see the overall game results

- It was both weird at times, and eye-opening at times. I had to look at myself in ways I've never considered. The survey worked well from a technical standpoint and I had no issues. Well done!
- I feel incredibly sad. I'm worried for my family and I hate our government. The handful of people there actually fighting for us are demonized/ My own mother posts those stupid articles. Billionaires are making record profits and wont pay their workers' sick leave. I'm angry. No one understands what's right and wrong anymore.
- Hope your staying healthy and have a wonderful day!
